BC101 - INTRODUCTION TO GEOGRAPHICAL INFORMATION SYSTEM COURSE

Course Duration: 5 Days

Training Fee: KSh. 23,200 | USD. 260

Course Registration: http://bit.ly/3b0CP4o

1.0. INTRODUCTION

Geographic Information System (GIS) is one of the most remarkable innovations of all time, which has become an essential tool in resource management and planning. It is an information system comprising hardware, software, methods, data and people, all working together to capture, store, manage and manipulate, analyze, & display spatial information, to solve complex problems and enable decision making. It uses the concept of location of entities, whereby nearly everything can be assigned a geographic location. It uses other basic concepts such as space, distance and direction.

1.1. COURSE OVERVIEW

This course will introduce you to the basics of GIS, with a focus of equipping you with fundamental skills of working with spatial data. It will introduce you to the nature, types and sources of spatial data and the use of various GIS Software to manage, analyze and visualize this data. The course includes both practical software training and explanations of the concepts you need to know to make informed decisions as you start your journey to becoming a GIS analyst.
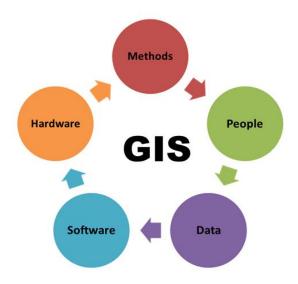

1.2. COURSE OBJECTIVES

- Understand what GIS is and what it can be used for i.e., its applications
- Get Started with various GIS Software in the market
- Know how to create and manage your own GIS data
- Understand the basics of Geospatial data management

1.3. COURSE CONTENT

i. *Introduction to GIS Concepts*

   - Definitions of core geospatial terminology and concepts
   - Objectives, components and applications of GIS
   - The history of GIS, how it is used today, and the future of GIS
   - Introduction to GIS Software – QGIS, ArcGIS Basics

ii. *Spatial Reference Systems*

   - Coordinate Reference Systems
   - Datum and Ellipsoids
   - Map Projections
   - Transformations

iii. Nature of GIS Data

- Data types and models
- Data Characteristics & metadata
- Feature representation in GIS
- GIS data sources
- Data Capture
- A shapefile and Feature class
- Data Editing
- Geo-referencing
- Digitizing in GIS
- Spatial and Attribute Data

iv. Geospatial Data Management

- GIS Data File Formats
- The Geodatabases: Features and Design
- File Geodatabases, Personal Geodatabases,
- Introduction to GIS database (Microsoft SQL), functions and applications
- Maintaining spatial and attribute data integrity using subtypes
- Performing GIS data validation
- Updating and managing the GIS databases

v. Geospatial Analysis

- Introduction to raster data Analysis; Extraction, Digital Elevation Models, Classification, etc.
- Introduction to vector data Analysis; Buffering, Clipping, etc.

1.5. EXPECTED LEARNING OUTCOMES

At the end of this course, learners should;

i. Have an understanding of what GIS is (Can you explain it to a fifth grader?)
ii. Have a basic understanding on the operation of ArcGIS and QGIS
iii. Be able to collect data from the field in real time, or from the internet and other sources
iv. Be able to import data into GIS software and perform basic spatial analysis

1.6. TRAINING MATERIALS/SOFTWARE

- A laptop/PC;
- ArcGIS Desktop;
- Quantum GIS.

1.7. WHO SHOULD ATTEND?

Anyone who wants to learn about mapping and GIS including;

- GIS/Geospatial Students;
- Urban/Spatial Planning Professionals;
- Regional Planning;
- UN Bodies e.g., UNHABITAT, UN;
- Ministry of Urban Development;
- Urban Transport Sector;
- Academic Institutions.

- Health Professionals;
